

# **PILOT'S OPERATING HANDBOOK**

This Pilot's Operating Handbook must remain in the aircraft and be accessible to the pilot all times.

(THIS PAGE IS INTENTIONALLY BLANK)

Dear Sirius Owner:

Congratulations on the purchase of your TL-3000 Sirius! You will find your new TL-ULTRALIGHT aircraft very enjoyable, extremely economical, and easy to maintain. The Sirius is the light sport plane. It is fast, economical, pleasing to the eye, and user friendly. We at TL-ULTRALIGHT are certain that your Sirius will give you hours and hours of leisure flying and enjoyment. With this Pilot's Operating Handbook (POH), we hope to help inform you about the design and operation of your aircraft.

This Pilot's Operating Handbook is to be used as a guide to assist the pilot to safely use the Sirius aircraft. The contents are not intended to be a final authority and although proofed extensively they are still not considered error free. Therefore, the pilot in command is the final authority for the safe operation of the aircraft. Should there be any questions or errors found in your reading this handbook please contact us immediately and we will issue a clarification. Please study and become familiar with this POH manual and the respective manuals for the propeller and rescue system.

Thank you again for your business. We look forward to a continuing satisfied customer relationship. Feel free to contact us if you have any questions or comments regarding your Sirius aircraft.

Fly safe! Fly fun!

Jiří Tlustý

--	-----------------	-------------	--	----------------------	-----

### 1.1 Introduction

This manual is written and organized to conform to the ASTM F2245, Design and Performance of a Light Sport Aircraft and ASTM F2746, Standard Specification for Pilot's Operating Handbook (POH) for Light Sport Airplane

# **READ BEFORE YOUR FIRST FLIGHT!**

# CAUTION

A copy is issued with each aircraft and is required to remain in the aircraft and be available to the pilot at all times.

# CAUTION

# All pilots of this aircraft must read and understand the operation and limitations of this aircraft design.

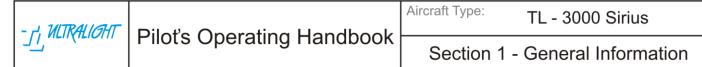

As such, many items are added as narrative information to assist them in clearly understanding what is required and in most cases help in achieving the necessary performance. The POH does not intend to and cannot replace properly qualified ground or in-flight instruction by an FAA certified flight instructor. (CFI)

Maintenance and operation of major components, engine, aircraft parachute system, propeller, avionics or other installed equipment is provided in the appropriate manufacturer manuals which are included with the aircraft. Any conflicts in this manual should be superseded by the appropriate manufacturer's manual.

# CAUTION

The Sirius is has a high cruising speed and may traverse very different weather conditions during a single flight. The aircraft is designed and intended only for operation in VFR/VMC conditions. The pilot is responsible for the safe flight of the aircraft and should be prepared to avoid any meteorological conditions which will endanger the occupants, the aircraft or both.

TL3000/12/001AJ	Rev. No.: 2	Original Issue Date: Revision Date:	7.1.2012 7.4.2018	1-2
-----------------	-------------	--	----------------------	-----

#### 1.2 Aircraft

The TL-3000 Sirius is a full three axis, high wing, two place, side-by-side seating, tricycle landing gear aircraft with a steerable nose wheel. The primary aircraft structure is carbon fiber and fiberglass UV resistant reinforced laminate with an inner foam core creating a 'sandwich' layered construction between each ply.

#### 1.2.1 Airplane gross weight

Gross weight: 1320 lbs with parachute rescue system

#### 1.2.2 Basic dimensions

Length:	22.15 ft.
Cabin width:	45 in.
Wing span:	80.84 ft.
Height:	7.38 ft. (at tail)

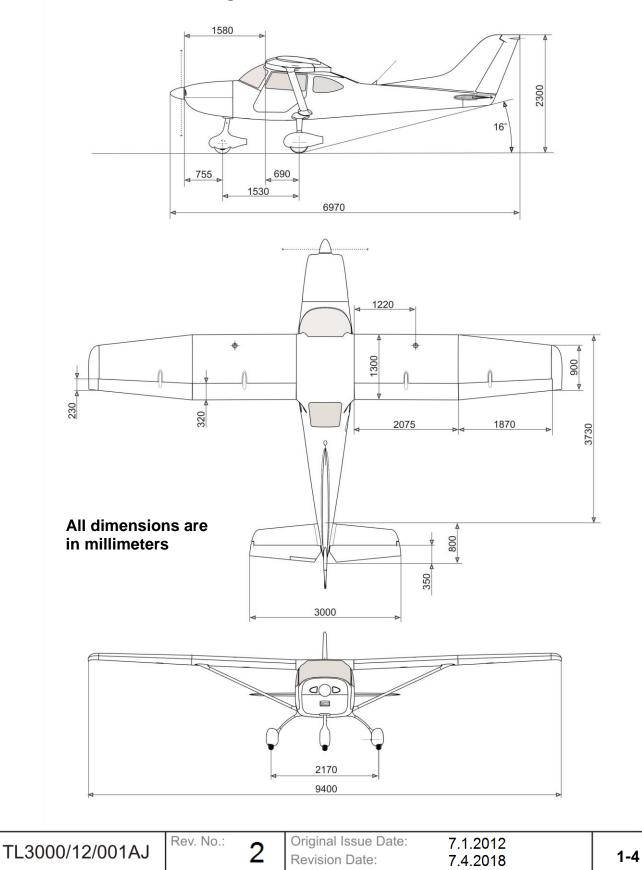

#### Areas

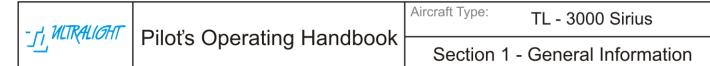

Wing:	121,23 ft <sup>2</sup>
Flap:	14.22 ft <sup>2</sup>
Aspect ratio:	7.92
Glide ratio:	13:1

3000/12/001A.    <b>7</b>  _	Original Issue Date: 7.1.2012 Revision Date: 7.4.2018	1-3
------------------------------	--	-----

#### 1.2.3 Three View Drawings

#### 1.2.4 Top speed, cruise speed

V	SPEED	KIAS (kts)	REMARKS
νн	Maximum sustained speed in level flight	120	Maximum speed with maximum continuous rated engine power in horizontal flight at sea level in standard conditions at full gross weight.

#### 1.2.5 Maximum range

Range:

max. 950 NM (No Wind / No Reserve)

# Maximum range cannot be obtained at high cruse power settings. For detailed engine data see the Operation manual for ROTAX<sup>®</sup> engine.

#### 1.2.6 Rate of climb

Rate of climb:950 ft/min at 65 KIAS, (VY, max power, half flaps)Maximum cruise speed:120 KIAS (VH, max continuous power)

#### 1.2.7 Stall speed

V	SPEED	KIAS (kts)	REMARKS
Vs	Stall speed (no flaps)	36	Do not attempt to fly slower than this speed at full gross weight when operating without flaps.
Vs0	Stall speed (full flaps)	31	Do not attempt to fly slower than this speed when operating with full (Landing) flaps.

TL3000/12/001AJ         Rev. No.:         2         Original Issue Date:         7.1.2012           Revision Date:         7.4.2018	1-5
---	-----

## 1.3 Fuel capacity

Total fuselage capacity: Wing fuel tanks capacity: Total unusable: Approved fuel grade: Alternate fuel grade:

34,4 Gals
2 x 17,2 Gals
1,7 Gals
91 Unleaded auto gas (yellow)
100LL Avgas (blue) (for *less* than 30% of engine operation time)

It is recommended to avoid fuels that contain ethanol.

## 1.4 Engine power

Horsepower rating and engine speed: 100 BHP at 5800 RPM

TL3000/12/001AJ	Original Issue Date: Revision Date:	7.1.2012 7.4.2018	1-6

Section 2 - Limitations

Notice! The information contained in this document is for reference and information only. The pilot is the final and only responsible party for the safe operation of this aircraft.

### 2.1 Speeds limitation

Speeds shown are for full gross weight at sea level, standard conditions.

#### 2.1.1 Airspeed indicator speed range markings

MARKING	KIAS (kts)	SIGNIFICANCE		
White arc 25 - 75 V <sub>s0</sub> in landing configuration. Upper limit is		Full-Flap Operating Range. Lower limit is maximum weight V <sub>S0</sub> in landing configuration. Upper limit is maximum speed permissible with flaps extended to stage one (Takeoff) (Approach) setting.		
Green arc	40 – 115	Normal Operating Range. Lower limit is maximum weight V <sub>s</sub> at most forward CG with flaps retracted. Upper limit is maximum structural cruising speed. VCMN		
Yellow arc	115 – 138	Caution Range. Operations must be conducted with caution and only in smooth air		
Red line	138	Never Exceed Speed. Maximum speed for all operations.		

#### 2.1.2 Stalling speeds

Stalling speeds at maximum take-off weight.

V	SPEED	KIAS (kts)	REMARKS
Vs	Stall speed (no flaps)	40	Do not attempt to fly slower than this speed at full gross weight when operating without flaps.
Vs0	Stall speed (full flaps)	35	Do not attempt to fly slower than this speed when operating with full (Landing) flaps.

#### 2.1.3 Flap extended speed range

V	SPEED	KIAS (kts)	REMARKS
Vfe	Maximum flap extended speed: Stage 1 flaps: Stage 2 flaps:	75 55	Do not exceed these speeds with the given flap settings. Damage to the flap mechanism may occur due to excessive air loads.
Vs0	Stall speed (full flaps)	35	Do not attempt to fly slower than this speed when operating with full (Landing) flaps.

TL3000/12/001AJ	Rev. No.: 2	Original Issue Date: Revision Date:	7.1.2012 7.4.2018	2-2
-----------------	-------------	--	----------------------	-----

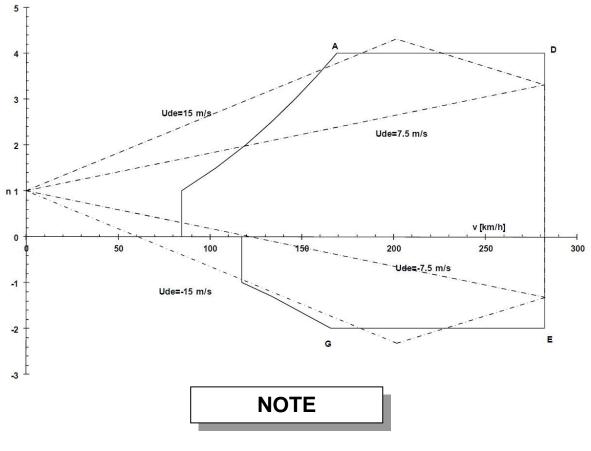

#### 2.1.4 Maneuvering speed

V	SPEED	KIAS (kts)	REMARKS
VA	Maneuvering speed	108	Do not make full or abrupt control movements above this speed.

#### 2.1.5 Never exceed speed

V	SPEED	KIAS (kts)	REMARKS
Vne	Never exceed speed	138	Do not exceed this speed in any operation.

### 2.2 Flight envelope

Speeds in V – n diagram are shown in kilometers per hour (km/h). 1 km/h = 0,540 kts 1 kts = 1,852 km/h

TL3000/12/001AJ	Rev. No.: 2	Original Issue Date: Revision Date:	7.1.2012 7.4.2018	2-3
-----------------	-------------	--	----------------------	-----

Section 2 - Limitations

Notice! The information contained in this document is for reference and information only. The pilot is the final and only responsible party for the safe operation of this aircraft.

## 2.3 Service ceiling

Standard conditions, standard day:16,500 ft.LSA altitude limits:10,000 ft. or 2,000 above terrain

## 2.4 Load factors limits

Flight load factors: flaps up: +4g, - 2g flaps down +2g, 0 g

### 2.5 Maneuver limits

This airplane is certified as a Light Sport Aircraft and is not approved for aerobatic flight, including spins. **All aerobatic maneuvers, including spins, are prohibited.** An aerobatic maneuver, as defined by 14 CFR 91.303, is an intentional maneuver involving an abrupt change in an aircraft's attitude, an abnormal attitude, or abnormal acceleration, not necessary for normal flight.

# WARNING

All aerobatic maneuvers, including spins, are prohibited.

#### 2.6 Fuel

Total capacity: Total unusable: Fuel consumption: Approved fuel grade: Alternate fuel grade: 34.4 Gals 1.7 Gals max. 7.13 Gals/h 91 Unleaded auto gas (yellow) 100LL Avgas (Blue)

## NOTE

100LL Avgas is to be used as an alternate fuel type if 91 octane auto fuel is not available. Use of 100LL Avgas is restricted to less than 30% of engine operation time by the engine manufacturer. If 91 Octane Unleaded is not available during travel, adding 100LL Avgas in any proportion to partial tanks of 91 Unleaded is acceptable.

#### It is recommended to avoid fuels that contain ethanol.

Section 2 - Limitations

Notice! The information contained in this document is for reference and information only. The pilot is the final and only responsible party for the safe operation of this aircraft.

#### 2.7 Horsepower rating, engine speed

Horsepower rating and engine speed: 100 BHP at 5800 RPM

### 2.8 Flight limitations

The Sirius is certified for VFR/VMC flight conditions. Operation under IMC conditions is considered an emergency unless the aircraft is so approved.

#### IFR Flight operations do not designate IMC flight conditions.

IFR operations limited to VMC conditions must be in accordance with the appropriate Manufacturer, FAA and ASTM standards.

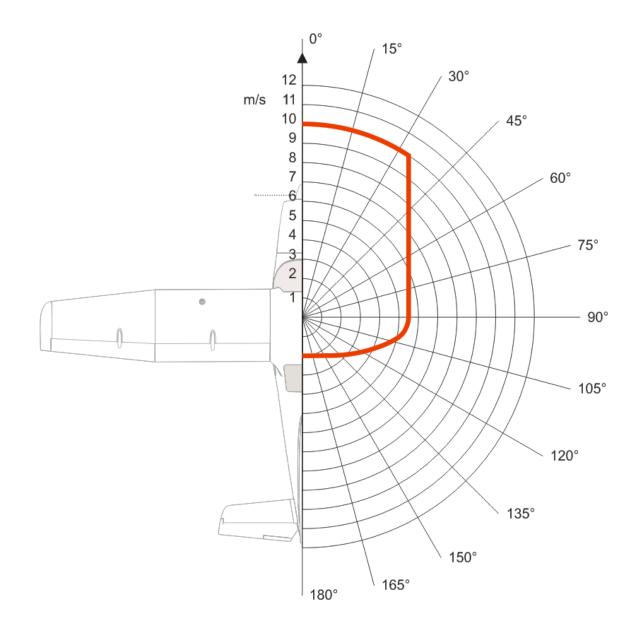

Approval for IMC operation by the manufacturer is aircraft specific. Each aircraft so approved will have specific IFR IMC restrictions in the POH appendix and a reference to these limitations will be displayed on the aircraft instrument panel.

#### 3.2.8 Inadvertent spiral

If a spiral dive is encountered at night or with an inadvertent cloud penetration (IMC/IFR conditions), proceed as follows:

WARNING
A spiral dive at night or in instrument meteorological conditions (IMC) is a serious, life threatening emergency. Consider the use of the GRS aircraft parachute system as the primary recovery technique.
ee Aircraft Parachute system deployment.
<ul> <li>f the aircraft parachute system is not deployed:</li> <li>AirspeedCHECK, IF THE AIRSPEED IS INCREASING</li> <li>ThrottleIDLE</li> <li>AirspeedCHECK, IF THE AIRSPEED IS DECREASING</li> <li>ThrottleFULL OPEN</li> <li>Level the wings using coordinated aileron and rudder until the wings of the attitude reference or turn coordinator are level. Do not attempt to change the nose pitch attitude until the bank indication is level.</li> <li>Apply elevator pressure using the attitude reference to maintain wings level until 65 KIAS is established on the airspeed indicator and the altimeter stops moving.</li> </ul>

- L. UITRALIGHT	Dilata Operating Handback	Aircraft Type:	TL - 3000 Sirius
	Pilot's Operating Handbook	Section 3 - Em	nergency Procedures

## CAUTION

When recovering from a nose-low attitude, do not overstress the airframe by pulling back too abruptly on the flight stick.

- 7. Trim the aircraft to maintain 55 KIAS
- 8. Upon re-entering VFR/VMC conditions, resume normal cruise operation

#### 3.2.9 Inadvertent spin

WARNING				
Intentional spins in this airplane are prohibited.				
Should an inadvertent spin occur in this airplane, the following recovery procedure should be used: 1. ThrottleIDLE 2. AileronsIDLE 3. RudderAPPLY FULL (in opposite direction of rotation) 4. ElevatorFORWARD (to break stall) 5. RudderFORWARD (to break stall) 5. RudderRECOVER SMOOTHLY FROM NOSE-LOW ATTITUDE				

TL3000/12/001AJ	Rev. No.: 2	Original Issue Date: Revision Date:	7.1.2012 7.4.2018	3-6

Section 3 - Emergency Procedures

Notice! The information contained in this document is for reference and information only. The pilot is the final and only responsible party for the safe operation of this aircraft.

## CAUTION

Close the throttle to prevent an unnecessary increase in airspeed. During a spin, one wing is in a stalled condition resulting in ineffective aileron inputs to control the rotation. Neutralize the ailerons, and apply full rudder in the opposite direction of rotation. Because an airfoil can stall at any airspeed and in any relation to the horizon, push forward on the stick to break the stall.

#### 3.2.10 Low oil pressure or loss of oil pressure

If a loss of oil pressure is accompanied by a rise in oil temperature, there is good reason to suspect an engine failure may occur. Reduce engine power and select a suitable field for a forced landing. Use only the minimum power required to reach the desired landing zone.

#### 3.2.11 Carburetor icing

Although the aircraft engine has a full time carburetor heating system, an unexplained drop in manifold pressure and eventual engine roughness may result from the formation of carburetor ice. Use both the throttle and the choke to maintain engine RPM.

#### 3.2.12 Exceeding maximum airspeed

If the aircraft exceeds  $V_{NE} = 138$  KIAS reduce power and speed immediately. Do not attempt abrupt control movement or unusual attitudes. Continue flight using minimum safe speed and control pressures to land as soon as possible. After landing have the aircraft airworthiness confirmed by a qualified mechanic to return it to service.

#### 3.3 Aircraft parachute system

#### 3.3.1 Introducing

The Sirius comes standard with an aircraft parachute. It is imperative that the owner/pilot of this airplane read and understand the system operating manual provided by manufacturer of parachute rescue system. In most emergency scenarios, the use of the system is not necessary. The parachute system will increase the chance of occupant survival.

TL3000/12/001AJ	Rev. No.: 2	Original Issue Date: Revision Date:	7.1.2012 7.4.2018	3-7
-----------------	-------------	--	----------------------	-----

Section 3 - Emergency Procedures

Notice! The information contained in this document is for reference and information only. The pilot is the final and only responsible party for the safe operation of this aircraft.

# WARNING

The aircraft parachute system should be considered as the primary method of choice of recovery when the aircraft has departed controlled flight (out of control).

# WARNING

## When using the parachute rescue system, please také into account that the plane will be destroyed!

If the system is used, certain steps should at least be attempted prior to activation: 1. Airspeed.....SLOW THE AIRCRAFT, IF POSSIBLE 2. Ignition.....OFF 3. Harnesses.....TIGHTEN

- 4. Parachute activation handle.....PULL FIRMLY (25 POUNDS)
- 5. Radio...... SET TO 121.5; TRANSMIT MAYDAY, MAYDAY,
- MAYDAY!" and AIRCRAFT ID with CURRENT POSITION 6. Transponder.....SET TO 7700 7. Impact position.....PULL LIMBS CLOSE TO **BODY and COVER FACE**

Firmly pull the parachute activation handle out 18 inches with about 25 pounds of force. The system should complete inflation in 1.5 – 3.5 seconds.

# WARNING

Maximum speed for aircraft parachute deployment at gross weight: 138 KIAS

TL3000/12/001AJ         Rev. No.:         Original Issue Date:         7.1.2012         3-8           Revision Date:         7.4.2018         3-8

# WARNING

Operation of both the engine driven and the auxiliary fuel pump for take-off and landing is not recommended. The combined pump output has been observed to overcome the carburetor float valve fuel cutoff, flooding the carburetor, preventing full power engine operation or cause engine failure.

#### 4.2.6 Takeoff

4-8

#### 4.2.11 Soft field

#### 4.2.11.1 Soft field take off

When taxiing over soft ground, keep constant back pressure on the flight stick to relieve stress on the nose strut. Set flaps on HALF position before entering the runway. Maintain elevator back pressure, and when clear for takeoff, add enough power to just get the airplane moving. As the airplane accelerates, smoothly add full power. As airspeed increases, raise the nose wheel off the ground, and when the airplane becomes airborne, level the nose to remain in ground effect until V<sub>X</sub> is reached and accelerate to V<sub>y</sub>. When V<sub>y</sub> has been established, continue on a normal climb-out.

#### 4.2.11.2 Soft field landing

The only difference between a normal landing and a soft field landing is keeping the nose wheel off the runway surface for as long as possible. To do this, float down the runway in ground effect rather than flaring to bleed off airspeed. This will decrease the sink rate to help prevent a hard landing. As the airspeed slows, flare just slightly enough to raise the nose wheel, but do not establish a high sink rate. Allow the airplane to settle to the runway. Roll, and as the airplane decelerates, allow the nose wheel to gently settle Do not allow the nose wheel to touch down on landing. This could result in the nose wheel digging into the soft runway and loss of airplane control. Continue the landing to the ground. Use as little braking as necessary throughout the entire landing and taxi.

#### 4.2.12 Balked (go around) landing

1. Throttle	FULL
	HALF
3. Airspeed	
4. Flaps	RETRACT WHEN CLEAR OF OBSTACLES
5. Airspeed	65 KIAS, V <sub>Y</sub>

#### 4.2.13 After landing

Section 5 - Performance

Notice! The information contained in this document is for reference and information only. The pilot is the final and only responsible party for the safe operation of this aircraft.

## Speeds shown are for standard equipped aircraft with the DUC Hélices FLASH propeller and 100 HP ROTAX engine.

### 5.1 Take off distances

Takeoff roll distance:**370 ft** max power, half flaps, paved RWYTakeoff distance over a 50ft obstacle:**1400 ft**, max power, half flaps, paved RWY

### 5.2 Rate of climb

Rate of climb: **950 ft/min** at **65 KIAS**, (V<sub>Y</sub>, max power, half flaps) flaps)Maximum cruise speed: **120 KIAS** (V<sub>H</sub>, max continuous power)

### 5.3 Cruise speed

Design cruise speed: **100 – 120 KIAS** Maximum cruise speed: **120 KIAS** (VH, max continuous power)

### 5.4 Fuel consumption

Maximum power: Maximum continuous power: 75% continuous power: 7,1 Galsl/h (Fuel flow at cruise altitude will be less)
6,6 Gals/h (Fuel flow at cruise altitude will be less)
4,9 Gals/h (Fuel flow at cruise altitude will be less)

For more information see the Operation manual for ROTAX<sup>®</sup> engine.

### 5.5 Landing distances

Landing roll with braking:490 ft, heavy braking, dry paved RWYLanding roll without braking:1200 ft, no braking, dry paved RWYLanding distance over a 50ft obstacle:1050 ft, idle power, full flaps, dry paved RWY

TL3000/12/001AJ     1000000000000000000000000000000000000

Section 6 - Weight & Balance

Notice! The information contained in this document is for reference and information only. The pilot is the final and only responsible party for the safe operation of this aircraft.

# 6. WEIGHT, BALANCE AND EQUIPMENT LIST

### TABLE OF CONTENTS

6.1 Pr	ocedure	6-2
6.2 En	npty weight center of gravity calculations	6-2
6.3 Lo	aded weight and balance calculations via diagram	6-4
6.4 Fo	rward center of gravity calculations	6-4
6.5 Re	ear center of gravity calculations	6-5
6.6 Ho	prizontal distance from datum plane	6-6
6.7 W	eight & balance data worksheet notes	6-6

TL3000/12/001AJ	Rev. No.:	2	Original Issue Date: Revision Date:	7.1.2012 7.4.2018	6-1

### 6.1 **Procedure**

It is the pilot's responsibility to make sure the weight and balance limits are not exceeded as to weight, its location, distribution and security prior to any flight.

All permanent equipment, options, and accessories should be installed on the aircraft prior to weighing.

Be sure to remove any loose equipment, tools, etc. from the aircraft prior to weighing.

Sometimes it is necessary to adjust or reduce fuel, cargo, or passenger weights to remain at or below Maximum Allowable Gross Weight. Temporary or permanent ballast is sometimes necessary to bring the CG within specified limits. However, the Maximum Allowable Gross Weight should not be exceeded under any circumstances

The fuel tanks should be empty except for unusable fuel. If the fuel tanks are not empty, then the exact amount of usable fuel in the tank must be determined. Usable fuel weight and its moment must be deducted from the Empty Weight calculations before EWCG can be accurately determined.

Oil and coolant tanks and reservoirs must be properly filled before weighing. These and any other liquids necessary for normal operations are considered part of an aircraft's empty weight.

For best results, weigh indoors. The scales must be calibrated correctly and must be set on level ground.

Any equipment placed on the scales when weighing the aircraft, such as chocks or blocks, should be weighed separately and the weight deducted from the scale reading.

The aircraft <u>must</u> be weighed in a level flight attitude, both longitudinally (front to back) and laterally.

Place a scale under each wheel of aircraft. If only one scale is used, <u>be sure to level</u> the wheels not being weighed before taking the scale readings. Remember, the aircraft must be in proper level flight attitude to ensure accuracy.

### 6.2 Empty weight center of gravity calculations

Place the aircraft on a triad of scales situated under the nose and main landing gear wheels.

TL3000/12/001AJ	Rev. No.:	Original Issue Date:	7.1.2012	
1L3000/12/001AJ		Revision Date:	7.4.2018	6-2

	- L. ULTRALIGHT	Pilot's Operating Handbook	Aircraft Type:	TL - 3000 Sirius
	Pliots Operating Handbook	Section 6	- Weight & Balance	

Read the GP and GH values from the scales (GH represents the sum of the values indicated by the scales under the main undercarriage wheels).

Calculate the total empty aircraft weight

 $G_{empty \ aircraft} = G_P + G_H \quad [lbs]$ 

Calculate the empty aircraft centre of gravity distance from the datum plane (wing leading edge)

$$x_{CG} = b - \frac{G_P \cdot (a+b)}{G_{empty \ aircraft}} \quad [mm]$$

Calculate the empty aircraft centre of gravity position in % MAC

$$x_{\% MAC} = \frac{(x_{CG} - c)}{MAC} \cdot 100 \quad [\% MAC]$$

а	840 mm
b	690 mm
C	35 mm
MAC	1230 mm

TL3000/12/001AJ	Rev. No.:	2	Original Issue Date: Revision Date:	7.1.2012 7.4.2018	6-3
-----------------	-----------	---	--	----------------------	-----

Section 6 - Weight & Balance

Notice! The information contained in this document is for reference and information only. The pilot is the final and only responsible party for the safe operation of this aircraft.

### 6.3 Loaded weight and balance calculations via diagram

**Pilot's Operating Handbook** 

Determine empty aircraft weight and empty aircraft centre of gravity position (see chapter 6.2).

Subtract the centre of gravity position shift increment for each individual item (crew, luggage, fuel) on the graduated scale.

Sum up so determined increments and add them to the empty aircraft CG.

The total gives the aircraft centre of gravity position at the chosen payload of each item given in % MAC and must fit within the allowed centre of gravity position range (22 - 32,5 % MAC).

### 6.4 Forward center of gravity calculations

On the pilot seat place 100 lbs (minimum pilot weight), in airplane there must not be any baggage, wing tanks must be empty

Read the GP and GH values from the scales (GH represents the sum of the values indicated by the scales under the main undercarriage wheels).

Calculate the total weight

- J. ULTRALIGHT

$$G_{total} = G_P + G_H \quad [lbs]$$

Calculate the centre of gravity distance from the datum plane (wing leading edge)

$$x_{CG} = b - \frac{G_P \cdot (a+b)}{G_{total}} \quad [mm]$$

Calculate the centre of gravity position in % MAC

$$x_{\% MAC} = \frac{(x_{CG} - c)}{MAC} \cdot 100 \quad [\% MAC]$$

### Permitted value of forward center of gravity is 22%

TL3000/12/001AJ         Rev. No.:         Original Issue Date:         7.1.2012           Revision Date:         7.4.2018	6-4
---	-----

### 6.5 Rear center of gravity calculations

To the baggage compartment place max. baggage weight -55 lbs, the rest of the weight in max. gross weight (1320 lbs with parachute rescue system) place on the pilot seats (max.250 lbs load on seat) and wing tanks must be empty

Read the GP and GH values from the scales (GH represents the sum of the values indicated by the scales under the main undercarriage wheels).

Calculate the total weight

$$G_{total} = G_P + G_H \quad [lbs]$$

Calculate the centre of gravity distance from the datum plane (wing leading edge)

$$x_{CG} = b - \frac{G_P \cdot (a+b)}{G_{total}} \quad [mm]$$

Calculate the centre of gravity position in % MAC

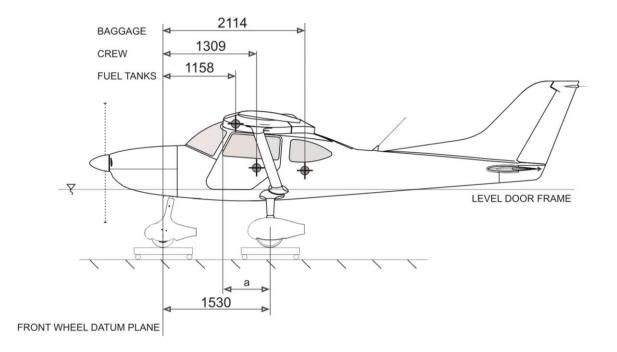

$$x_{\% MAC} = \frac{\left(x_{CG} - c\right)}{MAC} \cdot 100 \quad \left[\% MAC\right]$$

Permitted value of rear center of gravity is 32,5%

#### 7.1 Aircraft

The TL-3000 Sirius is a full three axis, one engine, high wing, two place, side-by-side seating, and tricycle landing gear aircraft with a steerable nose wheel.

### 7.2 Airframe

The primary aircraft structure is carbon fiber and fiberglass UV resistant reinforced laminate with a inner foam core creating a "sandwich" layered construction between each ply.

### 7.3 Flight controls

The aircraft's primary flight control system consists of two ailerons, a rudder, and a large elevator. The aileron and elevator control surfaces are mechanically, the rudder is manually operated by foot pedals.

### 7.4 Wing flap system

The aircraft utilizes plain-type flaps that are controlled by a three-position electric controller positioned in the lower panel ahead of the crew seats. The control panel also contains a flap position indication. In first position are flaps totally retracted, in next HALF position is angle of deflection 15° and flaps extended to FULL position has angle of deflection 45°.

### 7.5 Trim system

The rudder and right aileron are equipped with fixed, ground-adjustable trim tabs. The elevator has an in-flight, adjustable trim tab that is connected to a control lever in the cockpit.

### 7.6 Instrument panel

The instrument panel for the Sirius is arranged to suit the pilot's needs.

Sirius flight instruments are arranged in the basic "T" configuration on the pilot (left) side of the aircraft. Exceptions can include the absence of a particular instrument or a variation in the order of the instruments at customer request.

### 7.7 Safety harnesses

Each seat in the aircraft is equipped with a four-point safety harness.

TL3000/12/001AJ	Rev. No.: 2	Original Issue Date: Revision Date:	7.1.2012 7.4.2018	7-2
-----------------	-------------	--	----------------------	-----

### 7.8 Landing gear

The landing gear is convention a fixed, tricycle type with a steerable nose gear and two main landing gears. Hydraulically-actuated brakes are attached on each main landing gear wheel.

### 7.9 Engine

### 7.9.1 Engine specification

Number of engines:1Engine manufacturer:ROTAX® G.m.b.H. Aircraft EnginesEngine model Number:900 Series, Standard EquipmentEngine type:4-cylinder, 4-stroke liquid/air cooled, engine with opposed<br/>cylinders, dry sump forced lubrication with separated oil<br/>tank, automatic adjustment by hydraulic valve tappet, 2<br/>carburetors, mechanical fuel pump, electronic dual ignition,<br/>electric starter, propeller speed reduction unit.

NOTE

For actual and complete information see the Operation manual for ROTAX<sup>®</sup> engine supplied with the aircraft.

## WARNING

The ROTAX<sup>®</sup> 912UL engines are not certified. Even though the quality of assembly is of the highest priority to ROTAX<sup>®</sup>, failure of the engine may occur at any time. The pilot assumes full responsibility when operating the engine. The pilot is also responsible to fly the airplane at all times with the ability to glide and land safely in a predetermined area in case of engine failure.

The throttle controls the engine's manifold pressure, and is located on the middle console between the two crew positions.

### 8.1 Ground handling

### 8.1.1 Towing

Manipulate the aircraft with the use of nose gear attached tow bar only.

The rear section of the aircraft fuselage is not meant for manipulating. Never use your elbows to exert pressure onto the rear section of the aircraft fuselage as this may result in damage.

### 8.1.2 Parking

The aircraft will roll with very little effort. When parking the aircraft, it is recommended to chock the tires in order to ensure that the aircraft will not move. The aircraft can be equipped with a parking brake. Tie down rings are installed underneath each wing if a greater need for security is considered necessary by the pilot.

### 8.1.3 Tie-down

In the event that gusty or strong wind conditions exist, tying down the airplane is the best precaution to prevent damage. Metal screw rings are located underneath each wing tip for fastening tie-down straps or ropes. To tie-down the rear part of the airplane, use metal ring located under the rear part of the fuselage.

TL3000/12/001AJ	Rev. No.:	2	Original Issue Date: Revision Date:	7.1.2012 7.4.2018	8-2
-----------------	-----------	---	--	----------------------	-----

### 8.2 Servicing

### 8.2.1 Engine oil

For approved oil see the Operator's Manual for all version of ROTAX<sup>®</sup> 912. Do not use oil additives. Quality automotive motor oil, not approved for aircraft motor oil – for viscosity see Operator's Manual for all version of ROTAX<sup>®</sup> 912.

 Oil capacity:
 7.4 liq pt (3,5 l)

 Oil consumption:
 max 0.13 liq pt/h (0,06 l/h)

Prior to checking the engine oil level, run the engine at idle for a few minutes. Then, shut it down. As an alternate method, turn the engine by pulling the propeller over, by hand.

Before hand-cranking the propeller, <u>ensure that both ignition</u> <u>switches are in the off position</u>. For safety purposes, always treat a propeller as though the engine could start at any time while cranking.

# Never turn the engine backwards (clockwise when viewed from the front to the rear of the aircraft) permanent damage to the engine may result due to loss of oil pressure to critical components.

Open the access panel on the upper cowling. To check the oil, unscrew the cap of the oil reservoir located at the rear of the firewall. Remove the dipstick to check the oil level. A flattened segment at the end of the dipstick represents the oil capacity range. The top of this segment is the MAX limit and the bottom of the segment is the MIN limit. Ensure the oil level is between these limits, but it must **never** fall below the MIN limit.

To best protect your engine, change the engine oil and replace the oil filter every 25 hours of engine operating time or after cross-country operation with 100LL Avgas.

	Fliots Operating Handbook	Section 8	- Handling & Servicing

#### 8.2.2 Fuel

For approved fuel see the Operator's Manual for all version of ROTAX<sup>®</sup> 912.

It is recommended to avoid fuels that contain ethanol.

100LL Avgas is to be used only as an alternate fuel type if 91 octane auto fuel is not available. The use of 100LL Avgas is restricted to *less* than 30% of engine operation time.

### CAUTION

Before each flight remember to control and purge the fuel system and check the filter in the gascolator.

Fuel specification:Premium automotive unleaded that conform to ASTM D 4814Minimum AKI 89ROTAX® 912 ULMinimum AKI 91ROTAX® 912 ULSMinimum AKI 91ROTAX® 912 IS

Total capacity: Wing fuel tanks capacity: Total unusable: Fuel consumption: Approved fuel grade: Alternate fuel grade: 34.4 Gals
2 x 17.2 I
1.7 Gals
max. 7.13 Gals
91 unleaded auto gas (yellow)
100LL Avgas (blue) (for *less* than 30% of engine operation time):

Section 8 - Handling & Servicing

Notice! The information contained in this document is for reference and information only. The pilot is the final and only responsible party for the safe operation of this aircraft.

### 8.2.2.1 Safety instruction and procedure of fuel tank filling

### Safety instruction for filling fuel into the airplane tank(s)

**Pilot's Operating Handbook** 

- The fuel tank can be filed with fuel only by those individuals who are fully instructed and familiar with all fuel safety instructions.
- It is prohibited to fill the fuel tank during rain, storm, in closed space, when engine is operating or with electric system switched on.
- The person filling the fuel tank must not be wearing polyester clothing or any clothing from a material which creates static electricity.
- Do not smoke, use a cell phone, any static producing device, handle open flame or any electrical device during refueling.

### 8.2.2.2. Procedure of fuel tank filling

- Ground the airplane. The airplane ground point is located on the engine exhaust pipe.
- During the filling the fuel wing tanks do not support the ladder on the leading edge of the wing. Do not lean on the airplane during filling.
- Open the fuel tank cap.

- <sub>LI,</sub> ULTRALIGHT

• Fill with necessary quantity of fuel.

### CAUTION

# When filling into the airplane, avoid fuel contact with the airplane finish which may cause damage to surface of the airplane.

- When the airplane is filled with fuel, wipe the filler neck fuel and close the fuel neck filler cap.
- Remove conductive interconnection between the filling device and the airplane.

When fueling the airplane, ensure the airplane is electrically grounded by verifying that the grounding wire located on the right main gear wheel makes adequate contact with the ground's surface. Also, ensure the fueling container remains adequately grounded to fuel neck ring and nozzle. A ground wire from the refueling container should be attached to the engine exhaust pipe. The exhaust pipe is electrically connected to the aircraft ground system as are all fuel tanks and tank opening ports.

TL3000/12/001AJ	Rev. No.: 2	Original Issue Date: Revision Date:	7.1.2012 7.4.2018	8-5
-----------------	-------------	--	----------------------	-----

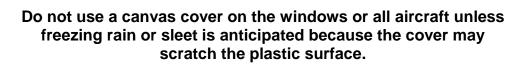

### 8.3 Cleaning and care

### 8.3.1 Windows

The cabin windows surface should be cleaned only with an aircraft windshield cleaner and one of the micro-fiber cloths which are provided. Do not wipe the windows in a circular motion. If the windows are covered with dust, use flowing clean water and lightly wipe the dust away with a clean hand (remove finger rings). This will remove (flow away) the grit that will scratch the plastic surface. Apply a sufficient but modest amount of cleaner to the windows surface and wipe in a long stroke fore/aft **linear** motion with light pressure until the surface is clear. Attempt to lift the dirt from the surface don't rub it into the windows or light scratches will appear in the sunlight reflections.

Never use glass cleaner, MEK, acetone, benzene, gasoline, fire extinguisher, anti-ice fluid, or lacquer thinner to clean plastic. These materials will attack the plastic and cause it to craze.

CAUTION

### 8.3.2 Propeller care

Proper preflight inspections of the propeller blades for nicks and cracks are key to maintaining a good propeller. Wiping down the blades to clean off bugs and grass is also advisable after EVERY flight. Whenever the airplane is parked, place the propeller covers over the blades to ensure that they are protected from the environment. A clean waxed propeller resists stains and is more efficient.

### 8.3.3 Engine care

Routinely perform a visual inspection of the engine. Check all oil, fuel, and coolant lines for any leakages, defective seals, or faulty connections. Ensure all electrical leads are fastened down tightly to help prevent intermittent electric problems. Check coolant, brake fluid, and engine oil levels to determine if there are any losses.

TL3000/12/001AJ	Rev. No.: 2	Original Issue Date: Revision Date:	7.1.2012 7.4.2018	8-6
-----------------	-------------	--	----------------------	-----

- r. ULTRALIGHT	Pilot's Operating Handbook	Aircraft Type:	TL - 3000 Sirius
	Fliots Operating Handbook	Section 8	- Handling & Servicing

Clean the radiator vanes from bugs and debris using a low pressure water hose and a cloth. Never use high pressure water to clean out the radiator. If a fault or discrepancy is discovered or any question is raised about the condition of the engine, consult a properly trained professional before operating the engine

#### 8.3.4 Interior care

To remove dust, loose dirt, and other debris from the upholstery and carpet, clean the interior regularly with a vacuum cleaner. Blot up any spilled liquids promptly and use stain remover as needed. Sticky substances can be removed by using a knife or scraper and then stain remover. Clean the instrument panel and control knobs with a very mild, non-conductive cleaner in order to remove oily deposits without compromising any electronic components.

TL3000/12/001AJ         Rev. No.:         Original Issue Date:         7.1.2012         8-7           Revision Date:         7.4.2018         8-7
